

# How to dispose of clinical waste

Advice for a non-clinical setting

- Place in a labeled yellow bin or double-bagged in a yellow bag and then in a leak-proof hard container.

- Spill kits must be available and used for cleaning up spills.

- Tie bags at the top and close bin lids.
- Bins should be at least 50% full before collection.

- Disinfect bins when they are placed out for collection.
- Sanitize your hands after touching the bins.

- Keep track of any spills, why they happened and any fixes applied.

- Don't compress the waste.
